Codes

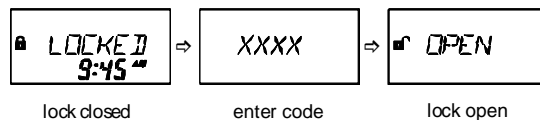

Duress code

Precondition for duress code recognition is that this function has been activated. To enter a duress code, the value 1 has to be added or deducted to the last or to the first digit of the code, depending on the code format setting.

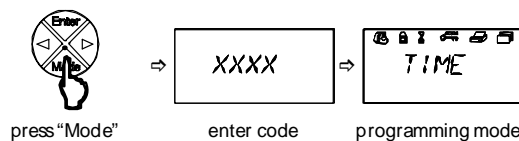

Code format ID/PIN or PIN/ID

By pressing the INF/ESC button, the code format is displayed: ID/PIN (=ID followed by PIN) or PIN/ID (=PIN followed by ID)

Lock opening

Access to programming mode

Status messages

Locked: the lock is mechanically closed. The current time is displayed. The lock may be opened by entering a valid code.

Open: the lock is mechanically open. The boltwork or the safe door can be opened during a time window of 6 seconds.

Weekly time lock: the lock is in a weekly time lock period or in an immediate time lock period and cannot be opened. The current time is displayed.

Holiday time lock: the lock is in a holiday time lock period and cannot be opened. The current time is displayed.

Time delay: after entering a valid code to open the lock the programmed time delay starts counting down.

Confirmation after elapse of time delay: once the time delay has elapsed, within a programmed time window the same code must be entered again as confirmation.

Dual mode: if dual mode is activated, two codes must be entered to open the lock. The second code is requested with this message.

Penalty after wrong trials: a penalty time of 5 minutes is initiated after the fourth consecutive false code has been entered.

Remote disabling: opening of the lock can be disabled by a remote signal. While Remote Disabling is active this message is shown while the lock is closed.

Identification with denied code: codes can be denied with a superior code, i.e. declared as invalid until possible further re-permission. Entering a denied code causes this message.

Battery compartment has been opened: this message is shown if the battery compartment, which also serves as a dismantling protection for the input unit, has been opened.
